

Conduit OS: The Simple Layman's Explanation

A plain-English guide to what Conduit OS is and how its four parts work together

Think of Conduit OS as a highly intelligent, fully automated "digital brain" for an e-commerce business.

Instead of a company having five different departments that don't talk to each other — where customer service doesn't know where a package is, inventory managers are guessing what to buy next, and the CEO is stressing over spreadsheets — Conduit OS connects all of these pieces into one smooth, automated system.

Here is what each of the four parts does in plain English, and how they work together:

1. conduit-core (The Vault)

What it does simply: This is the high-security foundation. Every single time a customer buys something on the Shopify website, this module catches that transaction, double-checks it to make sure it's not a duplicate or a fraud, and locks it safely into the database. It is built to never drop a single order, even if millions of people are buying things at the exact same second during a massive holiday sale.

How it ties in: It acts as the single source of truth. It instantly tells the other three modules: "Hey, a new order just came in, here are the details. Get to work!"

2. conduit-reply (The Automated Support Agent)

What it does simply: This is the customer service representative. Instead of making customers wait hours for a human agent to reply to an email, this AI agent instantly reads incoming customer messages. It can look up where their

package is, automatically update a shipping address, process a return, or answer product questions based on the brand's policies. If a customer is angry or has a highly complex problem, it neatly hands the conversation over to a human team member with a pre-written draft response ready to go.

How it ties in: It talks directly to The Vault (conduit-core) to verify that the person emailing actually bought the item, matching their order history instantly so the AI has full context.

3. conduit-ops (The Warehouse Forecaster)

What it does simply: This is the inventory manager. Running out of stock means losing money, but buying too much stock freezes up the business's cash. This module looks at how fast items are selling, blends in the upcoming marketing budget, and predicts the exact day the warehouse will run out of a product. Before that happens, it automatically drafts a purchase order for the factory and drafts an email to the supplier to get production started.

How it ties in: It watches how fast orders are piling up in The Vault (conduit-core) to adjust its math in real time. It ensures the warehouse always has the perfect amount of stock to fulfill the orders coming in.

4. conduit-cfo (The Executive Cockpit)

What it does simply: This is the business dashboard for the owner. It automatically pulls in data from Meta (Facebook) and Google ads, combines it with the sales data from Shopify, subtracts the cost of the products and shipping, and shows the founder their exact daily net profit in real time. It also features an AI chat box where the owner can type a plain English question — like "Which of our products made us the most money yesterday?" — and get an instant, accurate answer.

How it ties in: It sits at the very top of the ecosystem. It takes the sales data from conduit-core and the inventory cost data from conduit-ops, blending them

with external ad spend to give the business owner total financial clarity to run their brand.

How It All Ties Together: A Real-World Example

To see the magic of Conduit OS, let's look at what happens when a customer named Sarah buys a jacket:

1. **The Purchase:** Sarah buys a \$100 jacket. conduit-core instantly catches the transaction, verifies it, and logs it.
2. **The Operations Alert:** conduit-ops sees the sale. It recalculates the warehouse stock, realizes there are only 10 jackets left, and automatically drafts a purchase order to the manufacturer to make 500 more.
3. **The Customer Question:** Sarah emails asking, "Can I change my shipping address to my work address?" conduit-reply instantly grabs the email, matches Sarah to her order in conduit-core, updates her shipping address in Shopify, and replies to her in under 60 seconds confirming the change.
4. **The Bottom Line:** At midnight, the business owner logs into conduit-cfo. The system has automatically subtracted the \$20 cost of the jacket and the \$30 spent on the Facebook ad that targeted Sarah, showing the owner that they made a clean \$50 net profit on that transaction today.
